

Sfinx scripts

Many scripts are provided, for various uses.

Startup scripts for applications

For most of the installed software packages, a simple startup script takes care of setting up the environment and loading the package. In most cases, this takes the place of the sometimes very elaborate setups that are given with the package, to be added to the user's environment, possibly clashing with other packages. In other words, in order to run any of these packages, you don't have to follow setup instructions, but they just work by typing the command name.

Package	Script(s)	Additional notes
AIPS	aips	User needs to set up a .dadevs file to point to data areas
IRAF	iraf	Default startup. For additional options, see IRAF
	cl , ecl, ncl, vocl	Startup scripts for the various IRAF command language shells
	xiraf	Starts iraf inside an xgterm window

TO DO: extend list!!
