

Video Conferencing from the Desktop

There are multiple desktop clients available that allow you to connect to a remote Video Conferencing unit or connect into a multi-point meeting.

Zoom

The Sterrewacht has a (large number of) licenses for Zoom. See [separate page](#) for details.

Not Skype

Note that Video Conferencing is not Skype calling. Although it is possible to setup a Skype Video Conferencing meeting, it requires a Skype Business contract to enable this functionality and does not connect to the VC units we have available. Skype uses its own proprietary communication protocols that do not match the standard VC protocols.

Linux

For the Linux desktop there are a few public domain packages available:

- [ekiga](#)
- [starleaf breeze](#)
- [Zoom](#)

Windows

- [ekiga](#)
- [starleaf breeze](#)
- [WebEx](#)
- [Zoom](#)

Alternatives

There are free video conferencing tools that can be used in stead of zoom.

- [Jjitsi Meet](#)

Instituut Lorentz has their own [Jitsi server](#)
