

OpenVPN from MacOS

For MacOS there are two programs that can be used to connect to the STRW OpenVPN server: Tunnelblick or OpenVPN-connect. The most common one is Tunnelblick, but below we discuss both programs.

Tunnelblick

The most common used way to connect to an OpenVPN server from MacOS is using the [Tunnelblick software](#). You need to download the stable version of the software first:

- [Download stable version](#)

Install the software in the usual MacOS way.

- [Installing Tunnelblick](#)

You must obtain a STRW/IL OpenVPN configuration file. Mail helpdesk@strw.leidenuniv.nl or support@lorentz.leidenuniv.nl to request your personal .ovpn configuration file. Note this file includes your private VPN key. So keep it at a safe place!

Once you have obtained the .ovpn configuration file, installing it is very easy:

- You launch Tunnelblick by double clicking Tunnelblick in the Applications folder (Tunnelblick is running when you log out, shut down, or restart your computer, it will be launched automatically when you log in. It will also be launched automatically if any VPNs are active when you log in. Otherwise you will have to launch it manually when you need it.)
- Open both the Folder where you have saved the .ovpn file in Finder, and open the Tunnelblick→VPN Details panel. Now drag and drop the .ovpn file from the Finder onto the Left ('Configurations') panel.

Now you are all set to use VPN. You can close the VPN Details window and from the top bar you can click the Tunnelblick icon, which will now show your configuration file, prepended by the word 'Connect'. Just click that line and your VPN connection will be established.
